

Result

Greedy result

1. Route:

HKL → OPP → OQ → HM → TL

2. Metrics:

- Locations: 5/7 (71.4%)
- Total: 330 min (5.5h)
- Travel: 30 min (9.1%)
- Visit: 300 min (90.9%)
- End: 13:30
- States: ~7

A* result

1. Route:

HKL → OPP → OQ → HM → TL

1. Metrics:

- Locations: 5/7 (71.4%)
- Total: 330 min (5.5h)
- Travel: 30 min (9.1%)
- Visit: 300 min (90.9%)
- End: 13:30
- States: 266

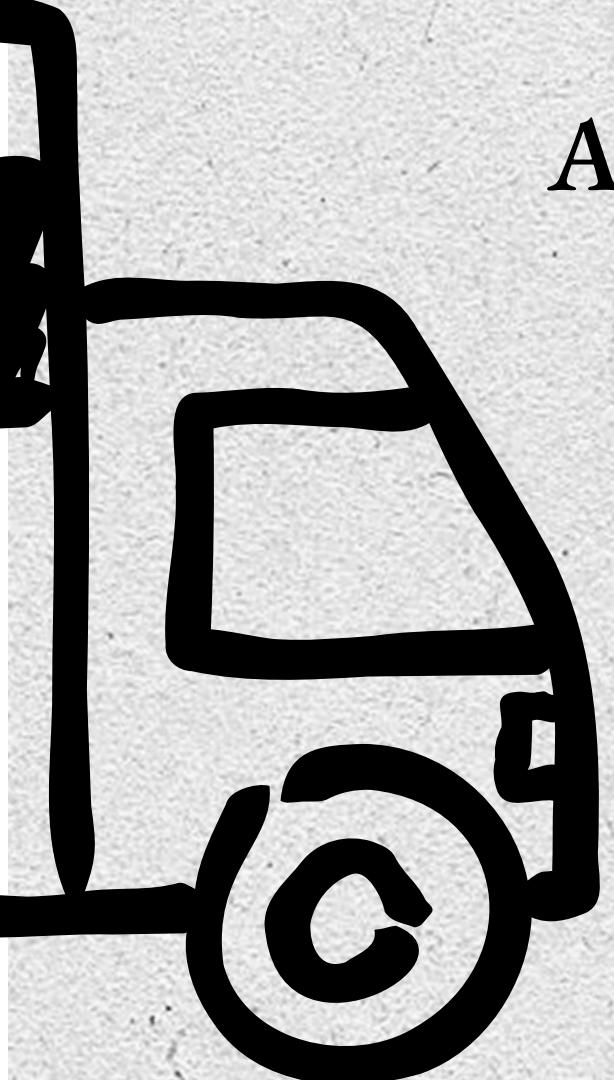

Side-by-Side Comparison

Metric	Greedy	A*	Winner
Route	HKL→OPP→OQ→HM→TL	HKL→OPP→OQ→HM→TL	Same
Locations	5/7	5/7	Same
Total time	330 min	330 min	Same
States	7	266	Greedy
Guarantee	None	Optimal	A*
Speed	<0.1s	<1s	Greedy

Critical Decision Point

At History Museum (11:55), 2 options:

- Option A: Temple of Literature Travel: 5 min
→ Total: 330 min
- Option B: Imperial Citadel Travel: 10 min
→ Total: 335 min

Critical Decision Point

- Greedy chose: TL ($5 < 10$, nearest)
- A chose:^{*} TL ($330 < 335$, global optimal)

Result: Both agreed!

Why Same Solution?

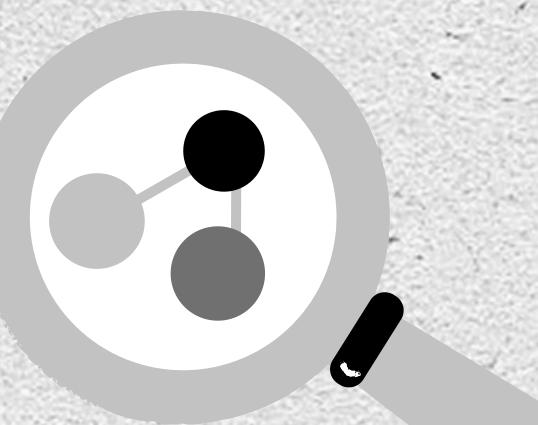

Problem characteristics favoring Greedy:

- Small size (7 locations)
- Simple constraints (time + opening hours)
- Regular distance structure
- Single objective (minimize time)

Greedy "got lucky" - nearest also happened to be globally optimal

A verified* - explored 266 states to PROVE it's optimal

Trade-offs & Recommendations

Use Greedy when:

01

Instant results needed

02

Mobile / real-time apps

03

Large-scale problems

```
    cout << "Enter rows and columns for second matrix: ";
    cin >> r2 >> c2;
    cout << "Enter elements of first matrix,
    row by row: ";
    for(i = 0; i < r1; ++i)
        for(j = 0; j < c1; ++j)
            cout << "Enter element a" << i + 1 << j + 1 << " : ";
    cout << endl;
    cout << "Enter elements of second matrix,
    row by row: ";
    for(i = 0; i < r2; ++i)
        for(j = 0; j < c2; ++j)
            cout << "Enter element b" << i + 1 << j + 1 << " : ";
    cout << endl;
    cout << "Multiplication result: ";
    for(i = 0; i < r1; ++i)
        for(j = 0; j < c2; ++j)
            cout << a[i][j] * b[i][j];
    cout << endl;
}
```

Trade-offs & Recommendations

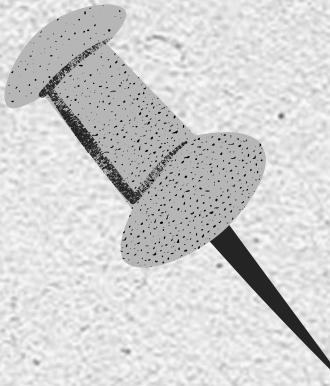

Use A* when:

- 01 Quality and optimality matter
- 02 Small–medium problems
- 03 Need proof of optimality

Conclusion

- Both found same optimal route (330 min)
- A* explored 38× more states
- Greedy succeeded by luck (~35%)
- Trade-off: Speed vs Guarantee

Thank
You
